3. Scope Of Works/Technical Specifications

3.1 BACKGROUND

The CoalCO₂-X technology captures the flue gas coming out of coal-fired boilers (carbon dioxide, sulphur oxides and nitrogen oxides) and converts them into value added products such as fertiliser salts, sulphuric and nitric acid, respectively, using hydrogen or ammonia. Provided the hydrogen and ammonia is generated from renewable energy (or low emissions) energy sources, the CoalCO₂-X technology can become a very effective way of reducing emissions in steel and cement production, as well as the power generation sector, where coal-fired boilers are used to provide process heat.

The CoalCO₂-X technology is seen as a game changer in assisting South Africa's transition towards a low carbon economy. Given South Africa's reliance on coal in electricity generation, the successful deployment of the Carbon Capture and Use (CCU) technology in the Eskom generating fleet and other hard to abate sectors has the potential to significantly improve South Africa's emissions profile, while ensuring energy security for the country and preserving jobs in the coal sector.

In 2019, the DSI established the CoalCO₂-X Programme focused on piloting the CCU technology in South Africa in support of South Africa's transition towards a low carbon economy. The first demonstration of the CCU technology was conducted at a cement plant in Dwaalboom, Limpopo province, where carbon dioxide (CO₂) was captured and converted into a fertiliser salt and significant emissions reduction was achieved. The second demonstration of the carbon capture and use technology was conducted in March 2024 at Kelvin Power Station in Kempton Park, where fertiliser salts such as ammonium bicarbonate and ammonium sulphate, as well as sulphuric acid were produced from the captured carbon dioxide and sulphur oxide.

The DSI is using the demonstration at Kelvin Power Station to contribute to the broader national discussion on how the transition from coal may be managed and the future role of coal in a cleaner energy system as well as informing and guiding the potential uptake and upscaling of the CCU technology in Eskom power plants.

To strengthen the business case for the adoption of CCU technology in South Africa, a techno-economic analysis (TEA) of the CCU technology from South African perspective is therefore key. The outcome of the process will inform if the technology is technically viable, economically feasible and, whether the technology can be practically implemented in South Africa, and at what cost.

3.2 OBJECTIVES

The primary objective of the TEA is to evaluate the feasibility and viability of the CCU technology within the South African context. The study aims to assess the technical aspects of CCU technology, including its capture efficiency, scalability, and integration with existing industrial processes. In addition, the TEA will analyse the economic viability by examining cost components, potential value chains and revenue streams, and market demand for CO₂-derived products.

3.3 SCOPE OF WORKS

The TEA involves intensive analysis of all CCU technologies to provide a suitable option that addresses South Africa's decarbonisation initiatives. The scope of work includes the following key aspects:

3.1 Identification of possible CCU technologies suitable for South Africa;

- Identify and screen current and emerging CCU technologies based on their relevance to South Africa's industrial landscape, including coal, cement, steel, and petrochemical industries.
- Assess the technical performance of each technology, including capture efficiency, energy consumption, process integration, scalability, and technology readiness levels (TRL).

3.2 Evaluate the feasibility of retrofitting or integrating CCU technologies with existing industrial processes.

Evaluation of the economic benefits and potential revenue streams from produced by-products from the CCU technology such as fertiliser salt and sulfuric acid, amongst others;

- Estimate the upfront investment required for deploying CCU technologies, including equipment, installation, and necessary modifications to existing infrastructure.
- Estimate ongoing operational costs, including energy, maintenance, labour, and materials.

3.3 Calculate the cost per ton of CO₂ captured and utilized, incorporating both CAPEX and OPEX.

Determination of whether or not the investment in CCU technology in South Africa will be profitable in the long-term; • Assess the market potential and revenue streams for products derived from captured CO₂, such as synthetic fuels, chemicals, and building materials. • Develop revenue projections under various scenarios, including fluctuating market prices, demand growth, and potential new market opportunities.

3.4 Market analysis and economic viability of the by-products derived from captured flue gas to understand the market demand, competition, and potential prices; • Analyse the current and projected demand for CO₂-derived products in South Africa and globally, considering competitive dynamics and market entry barriers.

3.5 Environmental assessment on benefits and impacts of CCU technology to ensure overall sustainability in relation to the uptake of the technology and its contribution to reducing greenhouse gas emissions; • Perform a lifecycle analysis to quantify the environmental impact of CCU technologies, including net carbon reduction, energy use, and resource efficiency.

3.6 Calculate the potential reduction in CO₂ emissions from implementing CCU technologies in South Africa's key industries. Review existing regulations and policies related to carbon emissions and assess the need for new or revised regulations to support CCU technology; • Evaluate the regulatory environment in South Africa, identifying potential challenges related to environmental compliance, permitting, and policy support for CCU.

3.7 Engagement with relevant stakeholders, including government agencies, industry players, environmental groups, and local communities, to gather input and ensure alignment with national priorities; and

3.8 Analysis of the economic implications of CCU technology, including cost-benefit analysis, potential job creation, and impacts on the energy sector.

- Evaluate the potential social impacts, including job creation, skills development, community acceptance, and the broader socio-economic benefits of CCU adoption.

3.9 Identify technical risks such as reliability, scalability, and integration challenges of CCU technologies.

3.10 Assess financial risks, including uncertainties in capital and operational costs, market volatility, and dependency on emerging markets for CO₂-derived products.

3.11 Develop strategies to mitigate identified risks, including technical redundancies, financial safeguards, and proactive regulatory engagement.

3.4 DURATION

The TEA is expected to be completed within a period of three months from the date of signature of the contract and will be initiated by a meeting between the service provider, SANEDI and the DSI.

3.5 STAKEHOLDERS

The identified key stakeholders that will inform the TEA include:

6.1. Government Agencies: Department of Science and Innovation, SANEDI, Department of Forestry, Fisheries and the Environment, Department of Mineral Resources and Energy; Department of Trade, Industry, and Competition;

6.2. Industry Players: Energy companies, manufacturing firms, and carbon-intensive industries, including Eskom and CPPE;

6.3. Academic and Research Institutions: Universities and research organizations specializing in climate science, engineering, and environmental studies;

6.4. Non-Governmental Organisations (NGOs): Environmental advocacy groups and community-based organisations;

6.5. Developmental Finance Institutions: Development Bank of Southern Africa and Industrial Development Corporation; and

6.6. Local Communities: Communities living near potential CCU project sites.

3.6 GOVERNANCE AND REPORTING

The existing Project Steering Committee that is providing strategic guidance and advice on the process pertaining to the potential acquisition of the CCU technology will also provide the necessary strategic guidance and advice in relation to the implementation of the TEA.

Reporting and presentation:

- A final report that includes an executive summary, detailed findings, and actionable recommendations for the deployment of CCU technologies in South Africa.
- A formal presentation of the study's findings and recommendations to the DSI, SANEDI and other relevant stakeholders.

3.7 CONCLUSION

The TEA results will be used, alongside other indicators such as perceived risk, technology readiness levels and local relevance, to develop a short list of priorities for the DSI.
